

The Problem of Organizing Digital Material

When files are scattered everywhere and named randomly, finding what you need becomes frustrating and causes unnecessary stress.

Too Many Random Folders

Files are saved in different places with no clear system, making it hard to remember where anything is stored.

Confusing File Names

Files are often named “final,” “final2,” or “newfinal,” which makes it difficult to know which version is correct.

Time Wasted Searching

People spend more time looking for files than actually working on them, slowing down productivity.

Proposed Solution

Create a **web-based application** that automatically sorts files, suggests clear file names, and allows tagging for easy searching. This system would save time, reduce stress, and help users stay organized across all their devices.
